Спортивный анализ данных. Платформа Kaggle

Урок 6. Feature Engineering, Feature Selection, part II

Домашнее задание:

Продолжим работу с данными, которые были использованы ранее, возьмем за основу набор данных с дополнительными признаками, которые были созданы в предыдущем задании (оставить все признаки, вне зависимости от того, добавляют они качества или нет).

Задание 0: Выбрать любимую модель и схему валидации решения, зафиксировать базовое качество модели.

Задание 1: Использовать внутренний способ для оценки важности признаков алгоритма, вывести его в виде диаграммы.

Задание 2: Удалить признаки с нулевой или маленькой важностью, переобучить модель и оценить изменение качества.

Задание 3: Использовать permutation importance , выполнить задание 1 и 2.

Задание 4: Использовать shap, выполнить задание 1 и 2.

Задание 5: Построить shap.summary_plot и shap.decision_plot для небольшой группы примеров (определить размер самостоятельно) и проанализировать влияние признаков на поведение модели.

Подключение библиотек и скриптов

XGBoost

В отличие от CatBoost или LGBM, XGBoost не может обрабатывать категориальные функции сам по себе, он принимает только числовые значения, подобные случайному лесу. Поэтому перед подачей категориальных данных в XGBoost необходимо выполнить различные кодировки, такие как кодирование меток, среднее кодирование или однократное кодирование.

В [68]:
```
# Модель
import xgboost as xgb
# Метрика
from sklearn.metrics import roc_auc_score, auc
from sklearn.model_selection import KFold, StratifiedKFold, train_test_split, cross_val_score
```

```

Базовое качество модели:

[180] validation_0-auc:0.92789 validation_1-auc:0.90977 (417 cols)

Учёт вклада полей в модель (F score):

```
> 20 [110]    validation_0-auc:0.90674    validation_1-auc:0.88975 (24 cols)
> 10 [160]    validation_0-auc:0.92392    validation_1-auc:0.90668 (49 cols)
> 4 [150]    validation_0-auc:0.92500    validation_1-auc:0.90742 (92 cols)
> 1 [150]    validation_0-auc:0.92549    validation_1-auc:0.90781 (146 cols)
= 1 [180]    validation_0-auc:0.92789    validation_1-auc:0.90976 (201 cols)
```

Задание 3:

Использовать permutation importance , выполнить задание 1 и 2.

[https://habr.com/ru/company/otus/blog/464695/ (https://habr.com/ru/company/otus/blog/464695/)](https://habr.com/ru/company/otus/blog/464695/) - Интерпретируемая модель машинного обучения. Часть 1

```
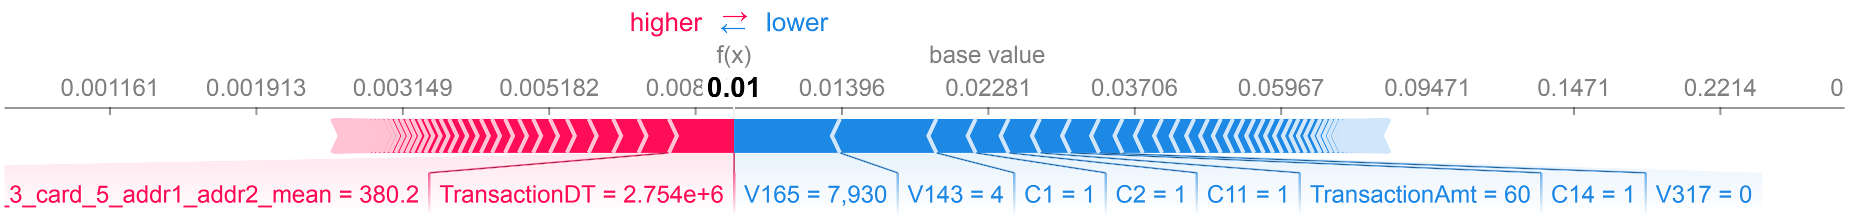
import shap
# load JS visualization code to notebook
shap.initjs()

x_valid_, y_valid_ = x_test_xgb_0.sample(2000), y_test_xgb_0.sample(2000)
```

В [135]:
```
explainer = shap.TreeExplainer(model)
shap_values = explainer.shap_values(x_valid_, y_valid_)
```

В [136]:
```
shap.force_plot(
    explainer.expected_value, shap_values[0,:], x_valid_.iloc[0,:], link="logit"
)
```

Out[136]:



Visualization omitted, Javascript library not loaded!

Have you run `initjs()` in this notebook? If this notebook was from another user you must also trust this notebook (File -> Trust notebook).

If you are viewing this notebook on github the Javascript has been stripped for security. If you are using JupyterLab this error is because a JupyterLab extension has not yet been written.

Решение:

```
# load JS visualization code to notebook
shap.initjs()
```

Задание 5:

Построить shap.summary_plot и shap.decision_plot для небольшой группы примеров (определить размер самостоятельно) и проанализировать влияние признаков на поведение модели.
